

Master no longer routes to a fixed industry list — it self-organizes Specialists from real conversation, and every task passes a local-first check before any model call is made.

Skills = procedure ("how"), memory cards = fact ("what"). Only genuinely new-territory work feeds the learning loop, and nothing is written back without dual confirmation and a scrub check.

/opt/data/.hermes/

```
memory/
  vector.db declarative cards (facts, patterns)
  cards/ human-readable export, for audit
  decay_queue.json flagged for review / pruning

skills/
  registry.json task_type → skill_id, version, use_count
  output/pdf_report/ SKILL.md + template + 1 example
  domain/<specialist>/<sub-segment>/

tools/
  runnable scripts & templates — called directly,
  not regenerated from a prompt each time

episodic/
  structured session hindsight, short retention,
  weekly-compacted into memory / skill cards

profiles/
  master/ orchestration, hot working memory
  <auto-created specialists>/ no predefined list —
  provisional → confirmed

cold_archive/ compressed, never auto-loaded
model_benchmark/ provider validation results
audit_log/ every write: who / what / when /
  confidence / scrubbed
```

Rule: nothing enters context unless it's the specific thing needed for the task at hand — retrieve, don't reload.

Everything a learning write touches — new fact, new skill, new Specialist, a merge — passes through the same confirmation and scrub gate, so growth stays auditable as the system scales.

Confidence Ladder

- Verified — user-confirmed or source-checked at write time
- Inferred — agent-derived, usable but flagged in output
- Contradictory — auto-flagged, routed to Master for review
- Unknown — not enough basis to assert; ask, don't guess

every retrieval returns its tag alongside the content
— this is what makes traceability real, not asserted

Gated Learning

- Specialist confirms: useful for my domain
- Master confirms: useful cross-domain / quality gain
- Scrub-before-promote — automated PII / client-ID check
- User reviews + approves before any write

auto-fix without approval only for: typo fixes,
rate-limit workarounds, obvious factual corrections

Specialist Lifecycle

- Create — no match found → new provisional profile
- Promote — sub-segment diverges enough → own Specialist
- Merge — two profiles' topics converge over time
- Dormant — unused profiles excluded from routing search

all four transitions go through the same
dual-confirmation gate as any knowledge write

Decay & Compaction

- Cards unused 90+ days, use_count < 2 → flagged for review
- Contradicted cards → archived, never left live
- Weekly job: episodic logs → distilled cards → cold archive

Working knowledge grows by curated card count,
not by raw transcript volume — stays fast to query
