

Hermes Meta-Intelligence — Master Architecture (v3.6)

The whole system at a glance: task flows from YOU, through the local-first agentic core, into sandboxed specialists and the model pool — with three live feedback loops.

Local-first: no API call until the cost-aware tier is chosen. Async Interrupt Poller observes inbound messages without blocking; P0 aborts, P1 re-orientes at safe yield points. Situation Model (atomic state.db) is the single source of truth.
